

Debugging Elixir in production

Fault tolerance

Your system works all the time!

...except when it doesn't.

Then what?

Logs and metrics

- observing system in real time
- diagnosing and predicting anomalies
- correlations between different metrics

You want a *lot* of metrics, so take care of performance and handle overload!

All those other tools

To sum it up:

1. logs and metrics
2. remote shell
3. etop
4. observer
5. tracing

Thanks!
